a One simulated run on a real field (DGPS, 6 m implement)

b Detail of the framed area

c Cross-section at one along-pass position (schematic): footprints of width *w*

Run score at this section:
$r^\star$ = largest half centre distance or edge distance
$S = \lambda + \max_x (r^\star(x) - w/2)$
no strip missed $\Leftrightarrow S \le \lambda$
